Fires which start during harvesting operations can destroy homes, crops and livelihoods. However many are preventable.

It is your responsibility to limit the ignition and prevent the spread of fires from your property.

This voluntary guide applies to all grain harvesting operations that occur “in the paddock” including the operation of grain harvesters, vehicles involved in the transporting of grain, grain dryers and grain augers.

Your responsibilities

Under the Rural Fires Act 1997, any public authorities and owners and occupiers of land have a duty to prevent fires starting or spreading from a property.

Land owners and occupiers must not use any machinery where heated parts of the machine comes into contact with combustible material.

If you are using machinery, or you are welding, using explosives or an angle grinder, you should always carry fire safety equipment such as:

- A knapsack spray pump with at least 16 litres of water; or
- A fire extinguisher (liquid type) of at least nine litres capacity; or
- A dry powder extinguisher of at least 0.9kg capacity.

When to cease harvesting

It is recommended that you cease harvesting operations when the Grass Fire Danger Index (GFDI) is 35 or more.

To make it easier, we’ve prepared the grain harvesting guide on the next page. This guide is a calculator that equates to a GFDI of 35.

### Grassland Fire Danger Index (GFDI) - Fire Behaviour Relationships

<table>
<thead>
<tr>
<th>Grassland Fire Danger Index (GFDI)</th>
<th>Rate of Spread (kph)</th>
<th>Difficulty of suppression</th>
<th>Maximum Area At Various Times From Start (Hectares)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>1/2 HR</td>
</tr>
<tr>

<td>100-149</td>
<td>6.4-12.8</td>
<td>Extreme Direct attack will generally fail</td>
<td>105-300</td>
</tr>
<tr>
<td>150+</td>
<td>12.8+</td>
<td>Catastrophic Direct attack will probably fail</td>
<td>300+</td>
</tr>
</tbody>
</table>
Using the grain harvesting guide - an example

Step 1
You will need to measure the current temperature, humidity and wind speed on your property. For wind speeds, you should average this reading out over 10 minutes. For humidity, round the number down.

Step 2
Then, using the measurements you’ve just taken, find the maximum recommended wind speed in the table. For example, a temperature of 40°C and 15% relative humidity equals 26 kph.

Step 3
Compare this result with the wind speed you recorded. If the wind speed you’ve recorded is equal to or greater than the number in the table, it is recommended you do not harvest. Reassess weather conditions later.

In this example, if the wind speed on your property is 26 kph or more, you should not harvest.

We acknowledge the South Australian Country Fire Service and South Australian Farmers Federation for their work in developing this guide.
